Hiring Manager, Applied Performance Group

Snowflake

Menlo Park, CA

Dear Hiring Manager,

I'm writing to apply for the Software Engineer role on the Applied Performance Group. I've spent the past year building production data pipelines on Snowflake at Aramark, and the work APG does, benchmarking, performance analysis, bridging engineering and customers, is the direction I want to grow in.

At Aramark I migrated a legacy SQL codebase to dbt, profiled execution plans, and redesigned transformations to reduce compute costs across pipelines processing 20M+ transactions a month at 2,000+ locations. I built real-time ingestion using Snowflake Streams, Snowpipe, and Azure Event Grid, and designed an alerting engine for fraud detection, hardware health, and reconciliation, 1,000+ alerts a day, 35% more accurate than what it replaced. Alongside Snowflake, I work daily with Palantir Foundry and Azure, which has given me a practical understanding of how these platforms differ in architecture and tradeoffs.

Before Aramark I was writing production SQL at WebstaurantStore, query performance analysis and defect monitoring on SQL Server. The platform was different but the approach was the same: identify what's slow, understand why, fix it, and verify the result with data.

I'm also comfortable working outside purely technical contexts. At sunhacks, ASU's largest hackathon, I managed a \$40K budget, secured sponsorships with Amazon and Garmin, and coordinated logistics for 600 attendees. The cross-functional nature of APG, working with engineering, sales, and product, is something I find genuinely appealing, not just a box to check.

I would love for the opportunity to learn more about the team and discuss how my background might be a fit.

Thank you for your time and consideration.
